

Our Energy Policy

BEHRINGER

Behringer GmbH is a leading supplier of innovative sawing technology with an international orientation. Our in-house iron foundry is a reliable supplier of castings for our own production and for end users in the mechanical engineering sector. In the manufacture of our goods, resource efficiency and sustainability, compliance with legal requirements and the use of energy-efficient production processes are self-evident principles.

With the introduction of an energy management system in accordance with DIN EN ISO 50001, we are continuing to the path we have already taken in the past to improve our energy efficiency consistently. For this reason, the management commits itself and all employees to actively apply and continuously improve the procedures laid down in the management system.

These are the principles for our actions in this context:

Constant monitoring and continuous improvement of our energy-related performance is an integral part of our management system. In doing so, we address the products, processes and activities that significantly influence our energy consumption.

We set ourselves the goal of reducing our energy consumption in the long term and are committed to observing and complying with the legal regulations applicable to our energy use.

We are pro-active in the economical, efficient and traceable use of energy as well as the procurement of equipment, products and energy resources.

We will regularly check that all employees are integrated into the implementation and execution of the energy management system.
